Stanbic Bank Kenya PMI™

Output growth dissipates as price pressures hit consumer spending

Key findings

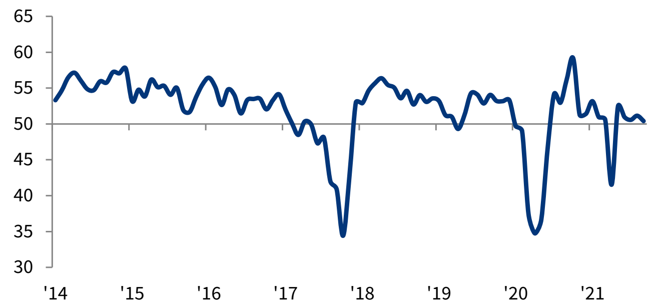
Output rises only marginally in September

Higher living costs weaken sales growth

Fastest rise in employment for eight months

PMI

sa, >50 = improvement since previous month



Sources: Stanbic Bank, IHS Markit.

Data were collected 13-28 September 2021.

Kenyan private sector activity grew at only a marginal pace in September, according to the latest PMI survey, as rising living costs weighed on consumer spending and new orders. The hike in energy prices particularly hit demand, as well as driving a sharper rate of both input cost and output charge inflation. More positively, capacity pressures led firms to increase their staffing levels at the strongest rate since January.

The headline figure derived from the survey is the Purchasing Managers' Index™ (PMI). Readings above 50.0 signal an improvement in business conditions on the previous month, while readings below 50.0 show a deterioration.

Falling from 51.1 in August to 50.4 in September, the headline index signalled an overall improvement in operating conditions. That said, the pace of improvement was marginal and the weakest seen in the current five-month sequence of growth.

Output and new orders rose in September, driven by a continued recovery in demand from the strict lockdown earlier in the year. Exports were also a key source of growth, as foreign orders increased at the fastest rate since October 2020.

That said, there were numerous reports that a rise in living costs had weakened consumer spending, leading to a softer - and only marginal - rate of total sales growth. Subsequently, the rate at which business activity expanded was the slowest seen since the return to growth following April's lockdown-induced decline.

Higher fuel prices was a key factor leading to the uptick in living costs. As well as impacting demand, businesses found that the price hike added to purchasing prices, which rose sharply. Faced with higher cost burdens, firms raised their selling charges to the greatest extent since February.

Backlogs of work meanwhile rose for the fourth month running, leading a number of companies to add to their staffing levels. Notably, the rate of employment growth was the quickest seen for eight months.

Input purchasing also expanded, and to the strongest degree since June, while firms saw delivery times shorten to the greatest extent in almost a year. These improvements supported another modest increase in inventory levels.

Lastly, the outlook for future activity remained relatively weak in September, despite improving slightly from August. Around 72% of respondents expect output to be unchanged over the coming year, amid uncertainty surrounding the pandemic and inflationary pressures. Positive forecasts were meanwhile driven by hopes of increased marketing and capital investment.

Comment

Kuria Kamau, Fixed Income and Currency Strategist at Stanbic Bank commented:

"Business conditions continued to improve in September but at the slowest pace in the past five months due to rising inflation. While export demand expanded by the fastest rate in 13 months, the improvement in domestic demand was negatively affected by a rise in output prices. Firms hiked output prices to protect their profit margins following a rise in fuel prices during the month. The level of work backlogs grew as firms were only able to increase their output marginally on account of the higher input costs. Despite improvements in the levels of employment and purchases, the future outlook for output continues to be relatively low on account of uncertainty around inflation and COVID-19."

Methodology

The Stanbic Bank Kenya PMI™ is compiled by IHS Markit from responses to questionnaires sent to purchasing managers in a panel of around 400 private sector companies. The panel is stratified by detailed sector and company workforce size, based on contributions to GDP. The sectors covered by the survey include agriculture, mining, manufacturing, construction, wholesale, retail and services.

Survey responses are collected in the second half of each month and indicate the direction of change compared to the previous month. A diffusion index is calculated for each survey variable. The index is the sum of the percentage of 'higher' responses and half the percentage of 'unchanged' responses. The indices vary between 0 and 100, with a reading above 50 indicating an overall increase compared to the previous month, and below 50 an overall decrease. The indices are then seasonally adjusted.

The headline figure is the Purchasing Managers' Index™ (PMI). The PMI is a weighted average of the following five indices: New Orders (30%), Output (25%), Employment (20%), Suppliers' Delivery Times (15%) and Stocks of Purchases (10%). For the PMI calculation the Suppliers' Delivery Times Index is inverted so that it moves in a comparable direction to the other indices.

Underlying survey data are not revised after publication, but seasonal adjustment factors may be revised from time to time as appropriate which will affect the seasonally adjusted data series.

September data were collected 13-28 September 2021.
